# Power To The (Adcomm) People: Members Believe Votes Should More Directly Affect US FDA Decisions

► By Derrick Gingery

**A SURVEY OF ADVISORY COMMITTEE MEMBERS finds many believe that an overwhelmingly negative vote should prevent a product approval.**

• • •

Many advisory committee members believe the panels should have more power over US Food and Drug Administration decisions, most notably the ability to block an approval.

A survey of people who have served on drug, biologic and device advisory committees over the last five years, conducted by 3D Communications, found that 63% believe there should be a threshold where an advisory committee vote is “so strongly against approval that the FDA should no longer consider approval for the product based on the currently available data,” according to slides presenting the results.

Of that group, the most (29%) placed the bar to prevent FDA clearance at when 75% or more committee votes are against approval. Another 12% said a 90% or greater negative committee vote, while 6% said a 50% or greater negative vote should prevent approval. (See chart below.)

About 27% of respondents said there should be no threshold.

Jim DiBiasi, co-founder of 3D Communications, said respondents were not necessarily seeking more power, but wanted appreciation for their service.

“When there’s an overwhelmingly negative vote, unless

they truly missed something, they feel it’s not really a recommendation,” DiBiasi said. “It’s a directive.”

The survey was prompted by the controversial FDA accelerated approval of Biogen, Inc./Eisai Co., Ltd.’s Alzheimer’s disease treatment Aduhelm (aducanumab-awwa) despite an overwhelming advisory committee rejection of the product. (Also see “Aducanumab Accelerated Approval Reflects US FDA Flexibility But Raises Doubts About Confirmatory Trial” - Pink Sheet, 7 Jun, 2021.) The agency decision caused three members of the Peripheral and Central Nervous System Drugs Advisory Committee to resign in protest. (Also see “Aduhelm Approval Firestorm Raises Question: What Are US FDA Advisory Committees For, Anyway?” - Pink Sheet, 11 Jun, 2021.)

3D Communications, a firm that helps drug companies prepare for advisory committee meetings and other sessions, surveyed 1,226 individuals, the total who had sat on an advisory committee during the past five years. Of those, 1,068 received the survey invitation and 247 responded. The firm said 201 respondents answered the threshold question.

Survey respondents also were asked when an FDA

approval was appropriate despite the majority of advisory committee members voting against it. The most popular answer, (48%), was “high unmet need or no available therapeutic options,” followed by “last-line treatment” (41%).

DiBiasi said that response suggests advisory committee members still seem to be open-minded about their role.

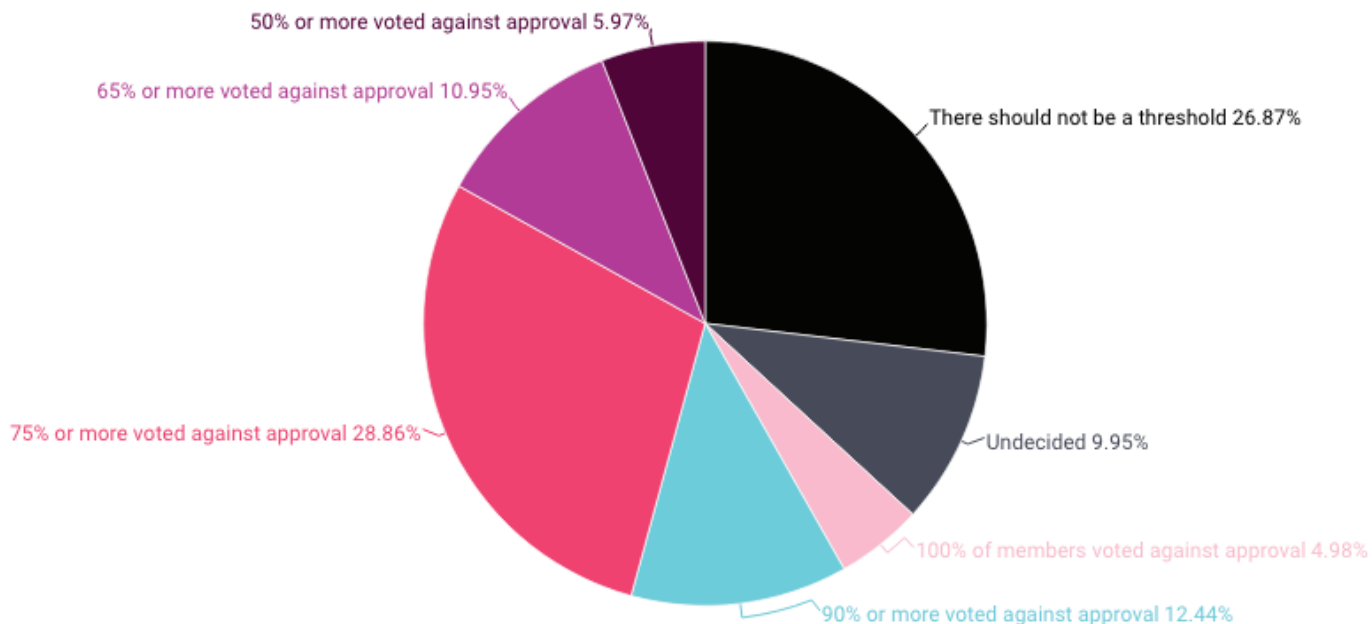

Interestingly, about 25% said “under accelerated approval or when a confirmatory study is required” and about 20%

said when patients are willing to accept the risk were acceptable reasons to ignore an advisory committee vote.

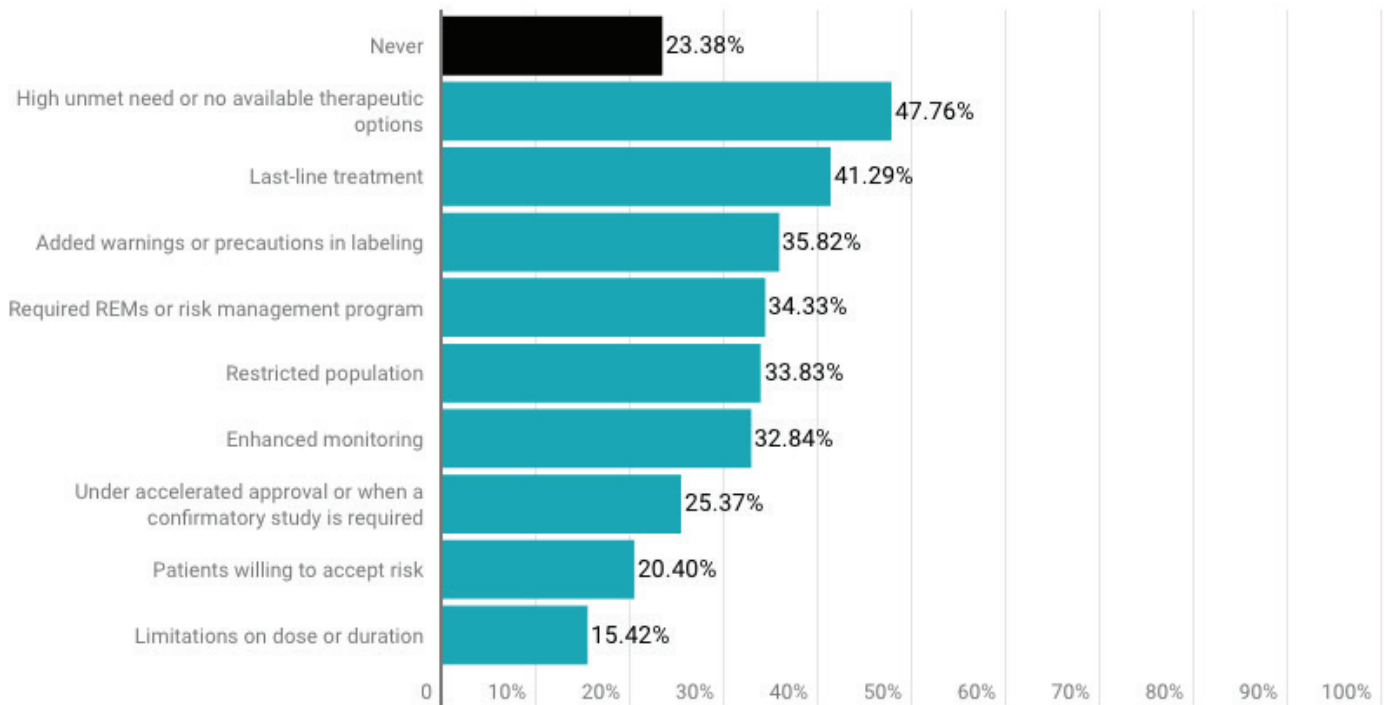

Patient testimony, almost always in favor of approval, has become a staple of advisory committee meetings. Many sponsors want to use the often-emotional anecdotal evidence to sway committee members. (Also see “US FDA Advisory Committee Reboot (Part I): Open Public Meeting A Place To Start?” - Pink Sheet, 28 Jun, 2021.)

### Adcomm Members Want Some Power Over FDA

63% of survey respondents said that a advisory committee vote should dictate that the FDA not approve a product. Most said the benchmark should be a 3/4 vote against approval.

## When Is Approving A Product Over Adcomm Vote OK?

### Chance For Power Shift Seems Slim To None

Committee members may feel they deserve some power over the drug approval process, but the likelihood of such a substantial change seems remote.

The FDA told the Pink Sheet that such a move “would not be consistent with applicable law or FDA’s obligation and authority to determine whether a new drug application should be approved or not.”

“FDA is obligated to approve, or not approve, drug applications solely in accordance with applicable statutory criteria, which do not include whether or not an advisory committee recommends approval,” the agency said.

Attorney Scott Lassman of Lassman Law and Policy said the agency should consider advisory committee votes, but retain the final decision on approval. He said limiting FDA discretion would be a mistake similar to mandatory minimum jail sentences.

“They both apply a bright line rule where there should be some discretion to account for individual circumstances,”

Lassman said.

Among the main functions of advisory committee meetings is to conduct a public discussion of the product in question. However, committee members sometimes misconstrue issues or diverge on tangents during their discussions, which can affect their votes and comments. Several meetings, including votes, also have ended with unclear advice on a product’s direction going forward. (Also see “Biosimilar Advisory Committee Reviews: Necessity Or Nuisance?” - Pink Sheet, 20 Jul, 2016.)

Indeed, in conjunction with the Aduhelm approval, FDA staff listed several issues they felt the advisory committee did not adequately consider. (Also see “FDA On What Aduhelm AdCom Got Wrong: Statistics, Investigational Drugs, Patient Perspective” - Pink Sheet, 29 Jun, 2021.)

Lassman also said the issue raises questions about the opposite situation, where the committee votes overwhelmingly in favor of approval, despite FDA concerns about safety or a lack of efficacy.

“Would FDA be required to approve if, for instance, 75% of the committee votes in favor of approval?” he asked.

The Pharmaceutical Research and Manufacturers of America also prefers the current structure, saying in a statement to the Pink Sheet that “while advisory committee recommendations do not and should not determine the outcome of regulatory decisions, the biopharmaceutical industry believes that advisory committee members, including the non-voting industry representatives assigned to each advisory committee, are an important part of the rigorous human drug review process we have in the United States.”

Cartier Esham, Biotechnology Innovation Organization chief scientific officer, highlighted the fact that the committees are used “to obtain independent expert advice on certain scientific and technical matters,” adding that the “scientific advice the agency receives from a committee is one component of a comprehensive regulatory determination that FDA must balance in ensuring approvals are both scientifically rigorous and patient-focused.”

### Changing The Intent

Attorney James Valentine, an associate at Hyman, Phelps and McNamara and former patient liaison in the FDA Office of Health and Constituent Affairs, said that a voting threshold would change the intent of the advisory committee meeting from an effort to bring in more expertise to a check on the decision-makers. And that could require massive changes to the process to more resemble an administrative law hearing.

Valentine added that the FDA uses committee votes as a discussion prompt. Agency officials prefer to hear the committee’s rationale and thinking behind a vote.

Center for Drug Evaluation and Research Director Patrizia Cavazzoni wants to rethink the advisory committee process potentially to include more members with direct expertise, as well as make other changes. (Also see “US FDA Advisory Committees Could Get Revamp With A Focus On Science Over Emotion” - Pink Sheet, 15 Jun, 2021.)

Several ideas already are under consideration, including clearer policies on when advisory committee meetings are appropriate. (See sidebar.)

Industry officials also are working on recommendations. (Also see “BIO 2021 Notebook: A Breakthrough Year For Emerging Companies?” - Pink Sheet, 15 Jun, 2021.)

### Adcomm Reputation Damaged, But Not Willingness To Participate

Survey respondents also were asked about the Aduhelm case, but only about half offered an opinion. About 40% said the FDA accelerated approval was not appropriate, while about 9.6% agreed with the decision. The remainder were undecided or had no opinion. (See charts at end of story.)

The vast majority of respondents (80%) said the Aduhelm decision did not change their willingness to participate in future advisory committee meetings. Another 7% said the decision made them more willing to participate. One of the 198 respondents who answered the question said the decision made them unwilling to participate in a future meeting.

A plurality of respondents (47%) also said the Aduhelm decision “impaired the reputation of the advisory committee process,” according to the slides. More than 29% said the decision caused no change to its reputation, while about 21% were undecided.

DiBiasi said the FDA’s decision to go against a nearly unanimous vote against Aduhelm’s approval was a bit surprising. While holding no opinion of the approval, he said the FDA could have done a better job communicating it.

“Clearly there was a disconnect between the benefit-risk the FDA saw and the benefit-risk the advisory committee saw,” he said. “I think it would have been prudent to explain that.”

Indeed, the agency has given multiple reasons for the label that Aduhelm received, but questions remain. (Also see “And Then There Were Three: Woodcock Offers Another Explanation For Aduhelm’s Labeling Fiasco” - Pink

Sheet, 14 Jul, 2021.)

Among the most criticized aspects of the decision was that the agency stated the amyloid hypothesis

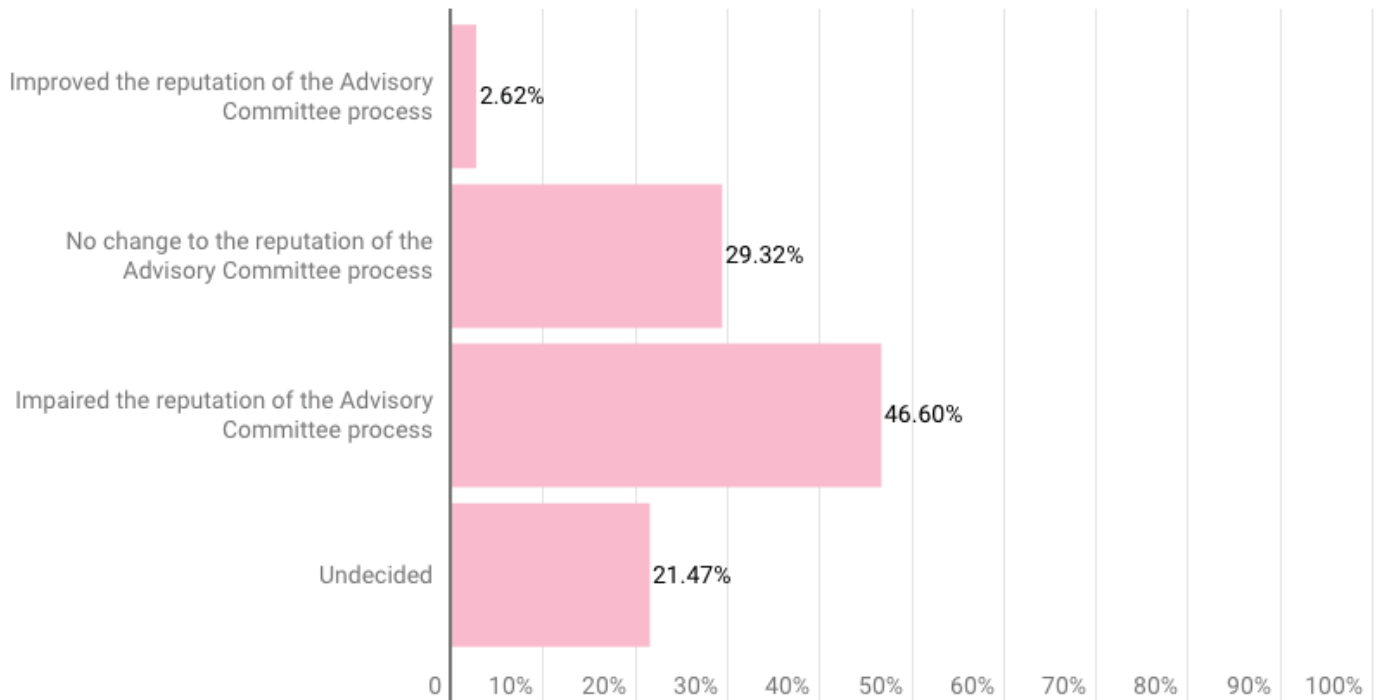

was an acceptable surrogate likely to predict clinical benefit despite numerous failed trials in the area. (Also see “Biogen Gets ‘Almost Shockingly Broad’ Label For Alzheimer’s Drug Aducanumab” - Pink Sheet, 7 Jun, 2021.)

### **Adcomm Members: Aduhelm Approval Inappropriate**

More survey respondents (79) said the Alzheimer’s drug’s approval was not appropriate than agreed with the decision (19), but most (100) were undecided or gave no opinion.

**Adcomm Process Reputation Also Damaged...**

**...But Willingness To Sit On Adcomms Did Not Change**
